

DBMS (CS-222) PROJECT PROPOSAL

SE (CS) Spring Semester 2026

Project Title	Court Case and Legal Document Management System		
Abstract	The Court Case and Legal Document Management System aim to design and develop a database-driven application to efficiently manage court cases and related legal documents. The system will store and organize information related to cases, parties involved, hearings, judgments, and legal documents in a structured manner. The project focuses on reducing manual record keeping and improving data accuracy, security, and retrieval speed. Using a centralized database, the system will allow authorized users to add, update, search, and view case details easily. It will also support tracking of case status and hearing schedules, ensuring systematic management of judicial records. NOTE: a) Data related to court cases will be collected from publicly accessible judicial portals, including official court websites and online case status and cause list pages. These sources provide non-confidential metadata such as case numbers, case types, court names, hearing dates, and case status formats. Due to privacy and confidentiality constraints, detailed case contents and sensitive personal information will not be used. Synthetic and assumption-based data will be generated to simulate various stages of case proceedings while preserving real-world judicial workflows and database integrity requirements. b) The system stores document metadata and uses synthetic document files for demonstration purposes.		
Group Members	Roll No.	Name	Signature
1	CS-24023	Syed Ramish Akhter	
2	CS-24035	Muhammad Ashar Khan	
3	CS-24037	Abdur Rahman Abdul Hafeez	
Tools to be used (both front end and back end)	Application development: HTML, CSS, Bootstrap, JavaScript, Django DBMS: Oracle Database (Oracle SQL Developer)		

Date of submission: *January 30, 2026*
